
SYSTEM CERTIFICATION

The **KVS System Certification** service is a required step in the installation or upgrade of any KVS system. During this process, KVS performs a complete inventory of the client's system to ensure that everything is compatible with the KVS applications being installed. This includes the server, workstations, printers, and any other specialty equipment that will be used. Any issues or concerns are identified in order to resolve them prior to going live. Another part of this process is the installation and configuration of all applications that are being deployed, including any third party software. Once everything is installed and configured, the entire system installation is documented including a detailed inventory of your devices for future support purposes.

SERVICE OVERVIEW
